Description

Cosmetic and dermatological preparation
for the removal of sebum

10

The present invention relates to the use of topical preparations for the removal of sebum from the skin, in particular for the removal and clearing of comedones, for avoiding comedone formation, for the prophylaxis and treatment of mild forms of acne, and for the prophylaxis and control of seborrhea.

15

Sebaceous gland overproduction and the possible skin disorders which develop as a result, such as sebum retention, formation of comedones in the region of the sebaceous glands, i.e. on the face (primarily forehead, nose and chin) and on the upper back and consequently the various forms of acne are a commonly encountered skin problem which has hitherto not been solved to a satisfactory degree.

20

Sebum is the secretion of the sebaceous gland. Sebaceous glands are protrusions of the follicle epithelium and thus constituents of the follicle with which they form a functional unit. They are holocrine glands, i.e. the entire gland cell is for the greatest part converted into the secretion sebum. The cells of the sebaceous gland, which are continually renewed from below, become fat and decompose, and the skin sebum formed as a result is emptied onto the surface of the skin through the follicle openings.

25

30 According to G. Leonardy (J.Ft. Jellinek Cosmetology, Zweck und Aufbau kosmetischer Präparate [Purpose and structure of cosmetic preparations], Dr. Alfred Hüthig-Verlag, Heidelberg - Mainz - Basel, third completely revised and significantly expanded edition 1976, pages 26 to 29), skin sebum consists of mono-, di- and triglycerides (C_{10} - C_{18}), waxes (C_{16} - C_{26}), wax esters (C_{28} - C_{38}), normal saturated fatty acids (C_{10} - C_{18}), branched-chain saturated fatty acids (C_{11} - C_{18}), multibranched-chain saturated fatty acids (C_{13} - C_{18}),
35 monounsaturated fatty acids (C_{11} - C_{18}), polyunsaturated fatty acids (C_{13} , C_{15} - C_{17}), sterols

(cholesterol, 7-dehydrocholesterol, 7-hydroxycholesterol), branched and unbranched hydrocarbons (C_{30} - C_{40}), squalene and phospholipids.

Together with the aqueous secretion of the eccrine sweat glands, the lipids of the sebaceous glands form the hydro-lipid film of the skin. This surface film is an emulsion which may be a water-in-oil or an oil-in-water emulsion. It has the function of keeping the surface of the skin supple and of regulating the water content of the deeper layers of the skin. If the sebum is well hydrated, the water content is at least 10 to 20% by weight and the sebum is hydrophilic. If the hydrophilic-lipophilic balance of the surface film is disturbed and the water content decreases, then the sebum changes and becomes hydrophobic. The flow of sebum from the sebaceous glands and follicles is impeded. This results in the skin sebum being trapped in the follicle openings with this then, as a result, possibly leading to comedones and inflammations of the follicles.

The change in the skin sebum and the onset of comedone formation can have various causes. For example: external influences, such as incorrect cleansing habits and incorrect care, comedogenous substances in cosmetics, weathering influences, alkaline soaps and harsh detergents. Increased sebaceous gland secretion and the formation of comedones can also develop as a result of genetic factors and hormonal influences. Here too, comedones, inflammations, preacne and acne with its secondary effects may be the result.

The frequency of skin damage as a result of disturbed sebaceous gland function and disorders of the sebaceous glands is ever increasing, and the reversal/avoidance of comedone formation is thus a pressing concern. However, attempts hitherto to solve comedone formation as a causal problem have led to results which are less than satisfactory.

As well as the manual removal of comedones by squeezing, numerous cleansing methods are known with which it is attempted to remove comedones and to permanently prevent comedone formation. These include special soaps, skin-peeling compositions and the like. Softening and astringent compositions are also used. Moreover, it is attempted to reduce the tendency for acne by adding drying, keratolytic, antiseborrheic and antibacterial active ingredients to cosmetic and pharmaceutical preparations, without irritations of the skin or drying of the skin arising.

However, skin cleansing degrades the skin and extracts moisture therefrom. In addition, soaps have the disadvantage that the water-insoluble calcium and magnesium salts of higher fatty acids, which form when the soaps are used in hard water, form slimy precipitates on the skin. Because they are difficult to rinse off, these precipitates remain for a relatively long period on the skin, block the follicle openings and can lead to the formation of comedones. For this reason, syndets (i.e. surfactants without soap character) are predominantly used in the form of washing creams or washing lotions for skin cleansing. Although these syndets do not form lime soaps, the treatment with highly surface-active agents has a greater degreasing and drying action than soap on the skin. The more often soap- and surfactant-containing products are applied to the skin, the more markedly their disadvantageous effects come to the fore, namely degreasing and drying of the skin as a result of destroying the hydro-lipid film. The reduction in comedones almost always leads to a reduction in the water content in the upper layers of the skin and to a solid concretum formation in the sebaceous glands, which in turn can induce inflammations. However, the reduction in the content of moisture of the skin is counterproductive for a gentle removal of the comedones.

Seborrhea is an increased function of the sebaceous glands as a result of predisposition. Both scalp and skin on the face appear greasy. The composition of the seborrheic sebum is changed as compared with normal sebum. Three development stages of seborrhea are distinguished:

1. Simple seborrhea, mild cases, greasy after 8 days.
2. Oily seborrhea, greasy after just 2-3 days.
3. Irreversible form, can no longer be reversed. The seborrhea in which the hair appears to be bathed in grease after just one day.

The excessive secretion of the sebaceous glands can, inter alia, be triggered by androgenetic disorders and has a detrimental esthetic effect on the overall appearance of the hair. This disorder can also be the cause for alopecia which arises. A forerunner is in each case the seborrheic condition of the scalp. Vegetative disorders and inappropriate care can further worsen the appearance of the skin and also the condition of the hair. Even in cases of seborrhea, the hair may itself be dry as a result of disturbances in keratin formation. Dry, damaged hair is frequently caused by external stress such as, for example, sun or chemical treatments. Blow drying at too high a temperature or incorrect care of affected hair can lead to damage.

The causes of greasy hair lie within the human body and are hormonally determined. Each hair has its own sebaceous gland which produces grease (sebum). Sebum production is controlled hormonally, and over- or under-production may result, depending on the hormone sensitivity of the sebaceous gland. The sebum itself has the function of keeping the scalp supple. It passes from the sebaceous gland onto the scalp and only later to the hair root, where it is normally taken up by the hair shaft and remains invisible. In the case of the overproduction of sebum, the hair shaft is no longer able to accommodate this and the sebum becomes visible as a greasy film on the hair. The result is straggly, greasy-lustrous hair.

As a result of the fact that sebaceous gland production is dependent on the hormone balance, the problem of greasy hair cannot be solved fundamentally since the sebaceous glands continually produce grease. Consistent care and high-quality grooming routines continue to be the best method of controlling greasy hair.

Greasy hair has very troublesome consequences. The hair becomes straggly again just a short time after washing and the hairstyle does not hold.

Contrary to popular opinion, it is only a rumor that the hair becomes greasy more quickly as a result of excessively frequent washing. Mild shampoos for greasy hair ensure that excess grease is removed. Hair and scalp are supplied with sufficient moisture and counterbalance the overproduction of the sebaceous glands.

Greasy hair and flaking are among the most common skin problems. These anomalies are to be attributed to a disturbance of sebaceous gland activity. If the sebaceous glands are hyperactive, the term used is seborrhea. In this connection, two forms can be differentiated: the oily form (seborrhea oleosa) and the dry form (seborrhea sicca).

Seborrhea oleosa:

Here, the sebaceous glands are hyperactive, producing too much, and excessively oily, sebum. The skin therefore has a greasy shine, and the hair is greasy and straggly again just 2 to 3 days after washing, right into the tips.

Seborrhea sicca:

This is likewise to be attributed to sebaceous glands being hyperactive, but the sebum is drier, and has a more solid consistency. With the small flakes of the epidermis, it forms large sebum flakes which are readily friable. The scalp has a wax-like shine, the hair becomes greasy only at the roots, the lengths and particularly the tips being dry and even brittle.

The treatment of seborrhea involves, firstly, regular and thorough washing of the head with special shampoos, which can be carried out as often as appears necessary. The washing should be combined with a massage in the connective tissue because this empties the sebaceous glands much more, which delays regreasing.

The object of the present invention is to make available a preparation which does not have the disadvantages of the known compositions used hitherto, which simultaneously has a sebum-dissolving, grease-regulating and care action, which removes comedones already present without irritation, which effectively prevents degreasing and drying of the skin, which prevents comedone formation and the development of acne cosmetica, and improves existing acne and which cares for the skin in a balanced manner.

This object is achieved according to the invention by the use of antiperspirant active ingredients for the manufacture of preparations for reducing the production of sebum.

Upon use of the preparation, the comedogenic action of the raw materials used in the preparation is surprisingly abolished and thus the formation of comedones and, accordingly, the development of acne is prevented.

It has also been found that the active ingredients used according to the invention prevent the formation of seborrheic phenomena, in particular greasy hair, but also dandruff, and eliminate seborrheic phenomena already present, in particular greasy hair, but also dandruff.

Suitable antiperspirants which can be used according to the invention are, for example, aluminum chlorohydrates. These are colorless, hygroscopic crystals which readily deliquesce in air and are formed upon evaporation of aqueous aluminum chloride solutions. Aluminum chlorohydrate is used for the preparation of antiperspirant and

deodorizing preparations and probably acts via the partial closure of the sweat glands by protein and/or polysaccharide precipitation. As well as the chlorohydrates, it is also possible to use aluminum hydroxylactates and acidic aluminum/zirconium salts.

- 5 The invention thus also provides a method for controlling blemished skin, acne, or seborrheic phenomena, in particular greasy hair and/or dandruff, which comprises bringing the active ingredients used according to the invention, in a suitable cosmetic or dermatological carrier, into contact with the area affected by increased sebum production.
- 10 The prior art did not provide the slightest indication of the use according to the invention as antiseborrheic active principle.

Further preferred embodiments of the present invention are therefore formulations to be used against dandruff, for example antidandruff shampoos.

15 According to the invention, the active ingredients are preferably used in cosmetic or dermatological preparations in a content of 0.0005-50.0% by weight, in particular 0.01-20.0% by weight, based on the total weight of the composition. The compositions advantageously comprise 0.02-10.0% by weight, particularly preferably 0.02-5.0% by weight, of the active ingredients used according to the invention, very particularly advantageously 0.5-3.0% by weight, in each case based on the total weight of the composition.

- 25 It may be advantageous according to the invention to add further agents which are effective against sebum to the preparations according to the invention, for example agents chosen from the group distarch phosphate, cyclodextrin, sodium corn starch octenyl succinate, silica dimethyl silylate, hydroxypropyl distarch phosphate, tapioca dextrin, aluminum starch octenyl succinate, acrylate copolymers, magnesium carbonate, corn starch, aluminum starch octenyl succinates, kaolin, nylon (e.g. Nylon 6/12),
30 bentonite, sodium silicoaluminate, boron nitride, silica, mica + titanium dioxide.

- 35 The combination of individual substances or two or more substances chosen from the above group with the antiperspirant active ingredients used according to the invention leads to a synergistic intensification of the effect of the individual substances and thus involves an independent inventive step.

The active ingredients used according to the invention can be incorporated without difficulties into customary cosmetic or dermatological formulations, advantageously into pump sprays, aerosol sprays, creams, ointments, tinctures, lotions and the like.

- 5 It is also possible and in some instances advantageous to combine the active ingredients used according to the invention with other active ingredients, for example with other antimicrobially, antimycotically or antivirally active substances.

10 It is advantageous to buffer the compositions according to the invention. A pH range from 3.5 – 7.5 is advantageous. It is particularly favorable to choose the pH in a range from 4.0 – 6.5.

15 The cosmetic and/or dermatological formulations according to the invention can have the customary composition and be used for the treatment of the skin and/or the hair in the sense of a dermatological treatment or a treatment in the sense of care cosmetics. They may, however, also be used in make-up products in decorative cosmetics.

20 For use, the cosmetic and/or dermatological formulations according to the invention can be applied in a sufficient amount to the skin and/or the hair in the manner customary for cosmetics and dermatological compositions.

According to the invention, customary antioxidants can be added to preparations which comprise the active ingredient combinations according to the invention.

- 25 The antioxidants are advantageously chosen from the group consisting of amino acids (e.g. glycine, histidine, tyrosine, tryptophan) and derivatives thereof, imidazoles (e.g. urocanic acid) and derivatives thereof, peptides, such as D,L-carnosine, D-carnosine, L-carnosine and derivatives thereof (e.g. anserine), carotinoids, carotenes (e.g. α -carotene, β -carotene, lycopene) and derivatives thereof, lipoic acid and derivatives thereof (e.g. dihydrolipoic acid), aurothioglucose, propylthiouracil and other thiols (e.g. thioredoxin, glutathione, cysteine, cystine, cystamine and the glycosyl, N-acetyl, methyl, ethyl, propyl, amyl, butyl and lauryl, palmitoyl, oleyl, γ -linoleyl, cholesteryl and glyceryl esters thereof) and salts thereof, dilauryl thiodipropionate, distearyl thiodipropionate, thiodipropionic acid and derivatives thereof (esters, ethers, peptides, lipids, nucleotides, 30 nucleosides and salts) and sulfoximine compounds (e.g. buthionine sulfoximines, homocysteine sulfoximine, buthionine sulfones, penta-, hexa-, heptathionine sulfoximine)

The amount of antioxidants (one or more compounds) in the preparations is preferably 0.001 to 30% by weight, particularly preferably 0.05 – 20% by weight, in particular 1 – 10% by weight, based on the total weight of the preparation.

The prophylaxis or the cosmetic or dermatological treatment with the active ingredient used according to the invention or with the cosmetic or topical dermatological preparations having an effective content of active ingredient used according to the invention is carried out in the usual manner, by applying the active ingredient used according to the invention or the cosmetic or topical dermatological preparations having an effective content of active ingredient used according to the invention to the affected areas of skin.

The active ingredient used according to the invention can advantageously be incorporated into customary cosmetic and dermatological preparations which may be in various forms.

Thus, they may, for example, be a solution, an emulsion of the water-in-oil (W/O) type or of the oil-in-water (O/W) type, or a multiple emulsion, for example of the water-in-oil-in-water (W/O/W) type or oil-in-water-in-oil (O/W/O) type, a hydrodispersion or lipodispersion, a gel, a solid stick or an aerosol.

Emulsions according to the invention for the purposes of the present invention, e.g. in the form of a cream, a lotion or a cosmetic milk, are advantageous and comprise, for

example, fats, oils, waxes and/or other fatty substances, and water and one or more emulsifiers as are customarily used for this type of formulation.

5 It is also possible and advantageous for the purposes of the present invention to incorporate the active ingredient used according to the invention into aqueous systems or surfactant preparations for cleansing the skin and the hair.

10 The person skilled in the art is of course aware that demanding cosmetic compositions are mostly inconceivable without the customary auxiliaries and additives. Examples thereof include bodying agents, fillers, perfume, dyes, emulsifiers, additional active ingredients, such as vitamins or proteins, light protection agents, stabilizers, insect repellents, alcohol, water, salts, and antimicrobially, proteolytically or keratolytically active substances etc.

15 Corresponding requirements apply mutatis mutandis to the formulation of medicinal preparations.

20 Medicinal topical compositions for the purposes of the present invention generally comprise one or more medicaments in an effective concentration. For the sake of simplicity, for a clear distinction between cosmetic and medicinal application and corresponding products, reference is made to the legal provisions of the Federal Republic of Germany (e.g. Cosmetics Directive, Foods and Drugs Act).

25 In this connection, it is likewise advantageous to add the active ingredient used according to the invention as an additive to preparations which already comprise other active ingredients for other purposes.

It is, for example, advantageous for the purposes of the present invention to use a content of UV protection substances.

30 Preparations according to the invention can therefore advantageously comprise substances which absorb UV radiation in the UVB region, the total amount of filter substances being, for example, 0.1% by weight to 30% by weight, preferably 0.5 to 10% by weight, in particular 1 to 6% by weight, based on the total weight of the preparations.

35 The UVB filters can be oil-soluble or water-soluble. Examples of oil-soluble substances are:

- 3-benzylidenecamphor and derivatives thereof, e.g. 3-(4-methylbenzylidene)camphor,
- 4-aminobenzoic acid derivatives, preferably 2-ethylhexyl 4-(dimethylamino)benzoate and amyl 4-(dimethylamino)benzoate;
- 5 - esters of cinnamic acid, preferably 2-ethylhexyl 4-methoxycinnamate and isopentyl 4-methoxycinnamate;
- esters of salicylic acid, preferably 2-ethylhexyl salicylate, 4-isopropylbenzyl salicylate and homomenthyl salicylate;
- derivatives of benzophenone, preferably 2-hydroxy-4-methoxybenzophenone,
- 10 2-hydroxy-4-methoxy-4'-methylbenzophenone and 2,2'-dihydroxy-4-methoxybenzophenone;
- esters of benzalmalonic acid, preferably di(2-ethylhexyl) 4-methoxybenzalmalonate;
- 2,4,6-trianilino(p-carbo-2'-ethyl-1'-hexyloxy)-1,3,5-triazine.

15 Advantageous water-soluble substances are:

- 2-phenylbenzimidazole-5-sulfonic acid and salts thereof, e.g. sodium, potassium or triethanolammonium salts,
- sulfonic acid derivatives of benzophenones, preferably 2-hydroxy-4-methoxybenzophenone-5-sulfonic acid and the salts thereof;
- 20 - sulfonic acid derivatives of 3-benzylidenecamphor, such as, for example, 4-(2-oxo-3-bornylidenemethyl)benzenesulfonic acid and 2-methyl-5-(2-oxo-3-bornylidenemethyl)sulfonic acid and the salts thereof.

25 The list of said UVB filters which can be used according to the invention is of course not intended to be limiting.

It can also be advantageous to use UVA filters which are customarily present in cosmetic and/or dermatological preparations in preparations according to the invention. Such filter substances are preferably derivatives of dibenzoylmethane, in particular 1-(4'-tert-butylphenyl)-3-(4'-methoxyphenyl)propane-1,3-dione and 1-phenyl-3-(4'-isopropylphenyl)-propane-1,3-dione. Preparations which comprise these combinations are also provided by the invention. It is possible to use the same amounts of UVA filter substances as have been given for UVB filter substances.

35 Cosmetic and/or dermatological preparations for the purpose of the present invention can also comprise inorganic pigments which are customarily used in cosmetics for protecting

the skin against UV rays. These are oxides of titanium, zinc, iron, zirconium, silicon, manganese, aluminium, cerium and mixtures thereof, and modifications in which the oxides are the active agents. Particular preference is given to pigments based on titanium dioxide. It is possible to use the amounts given for the above combinations.

5

The cosmetic and dermatological preparations used according to the invention can comprise cosmetic active ingredients, auxiliaries and/or additives as are customarily used in such preparations, e.g. antioxidants, preservatives, bactericides, perfumes, antifoams, dyes, pigments which have a colouring action, thickeners, surface-active substances, emulsifiers, emollients, moisturizers and/or humectants, fats, oils, waxes or other customary constituents of a cosmetic or dermatological formulation, such as alcohols, polyols, polymers, foam stabilizers, electrolytes, organic solvents or silicone derivatives.

10

If the cosmetic or dermatological preparation for the purposes of the present invention is a solution or emulsion or dispersion, solvents which may be used are:

15

- water or aqueous solutions
- oils, such as triglycerides of capric or caprylic acid, but preferably castor oil;
- fats, waxes and other natural and synthetic fatty substances, preferably esters of fatty acids with alcohols of low carbon number, e.g. with isopropanol, propylene glycol or glycerol, or esters of fatty alcohols with alkanolic acids of low carbon number or with fatty acids;
- alcohols, diols or polyols of low carbon number, and ethers thereof, preferably ethanol, isopropanol, propylene glycol, glycerol, ethylene glycol, ethylene glycol monoethyl or monobutyl ether, propylene glycol monomethyl, monoethyl or monobutyl ether, diethylene glycol monomethyl or monoethyl ether and analogous products.

20

25

In particular, mixtures of the abovementioned solvents are used. In the case of alcoholic solvents, water can be a further constituent.

30

35

The oil phase of the emulsions, oleogels or hydrodispersions or lipodispersions for the purposes of the present invention is advantageously chosen from the group of esters formed from saturated and/or unsaturated, branched and/or unbranched alkanecarboxylic acids having a chain length of from 3 to 30 carbon atoms and saturated and/or unsaturated, branched and/or unbranched alcohols having a chain length of from 3 to 30 carbon atoms, and from the group of esters formed from aromatic carboxylic acids and

saturated and/or unsaturated, branched and/or unbranched alcohols having a chain length of from 3 to 30 carbon atoms. Such ester oils can then advantageously be chosen from the group consisting of isopropyl myristate, isopropyl palmitate, isopropyl stearate, isopropyl oleate, n-butyl stearate, n-hexyl laurate, n-decyl oleate, isooctyl stearate, isononyl stearate, isononyl isononanoate, 2-ethylhexyl palmitate, 2-ethylhexyl laurate, 2-hexyldodecyl stearate, 2-octyldodecyl palmitate, oleyl oleate, oleyl erucate, erucyl oleate, erucyl erucate, and synthetic, semisynthetic and natural mixtures of such esters, e.g. jojoba oil.

10 The oil phase can also advantageously be chosen from the group of branched and unbranched hydrocarbons and hydrocarbon waxes, silicone oils, dialkyl ethers, the group of saturated or unsaturated, branched or unbranched alcohols, and fatty acid triglycerides, namely the triglycerol esters of saturated and/or unsaturated, branched and/or unbranched alkanecarboxylic acids having a chain length of from 8 to 24 carbon atoms, in particular 12 - 18 carbon atoms. The fatty acid triglycerides can, for example, be advantageously chosen from the group of synthetic, semisynthetic and natural oils, e.g. olive oil, sunflower oil, soya oil, peanut oil, rapeseed oil, almond oil, palm oil, coconut oil, palm kernel oil and the like.

20 Any mixtures of such oil and wax components can also be used advantageously for the purposes of the present invention. In some instances, it may also be advantageous to use waxes, for example cetyl palmitate, as the sole lipid component of the oil phase.

25 The oil phase is advantageously chosen from the group consisting of 2-ethylhexyl isostearate, octyldodecanol, isotridecyl isononanoate, isoeicosane, 2-ethylhexyl cocoate, C₁₂₋₁₅-alkyl benzoate, caprylic/capric triglyceride, dicaprylyl ether.

30 Particularly advantageous mixtures are those of C₁₂₋₁₅-alkyl benzoate and 2-ethylhexyl isostearate, those of C₁₂₋₁₅-alkyl benzoate and isotridecyl isononanoate, and those of C₁₂₋₁₅-alkyl benzoate, 2-ethylhexyl isostearate and isotridecyl isononanoate.

Of the hydrocarbons, paraffin oil, squalane and squalene are to be used advantageously for the purposes of the present invention.

35 Advantageously, the oil phase can also have a content of cyclic or linear silicone oils, or consist entirely of such oils, although it is preferred to use an additional content of other oil

phase components apart from the silicone oil or the silicone oils.

Cyclomethicone (octamethylcyclotetrasiloxane) is advantageously used as the silicone oil to be used according to the invention. However, other silicone oils can also be used advantageously for the purposes of the present invention, for example hexamethylcyclotrisiloxane, polydimethylsiloxane and poly(methylphenylsiloxane).

Mixtures of cyclomethicone and isotridecyl isononanoate, and of cyclomethicone and 2-ethylhexyl isostearate are also particularly advantageous.

The aqueous phase of the preparations according to the invention optionally advantageously comprises

- alcohols, diols or polyols of low carbon number, and ethers thereof, preferably ethanol, isopropanol, propylene glycol, glycerol, ethylene glycol, ethylene glycol monoethyl or monobutyl ether, propylene glycol monomethyl, monoethyl or monobutyl ether, diethylene glycol monomethyl or monoethyl ether and analogous products, and also alcohols of low carbon number, e.g. ethanol, isopropanol, 1,2-propanediol or glycerol and, in particular, one or more thickeners which can advantageously be chosen from the group consisting of silicon dioxide, aluminum silicates, polysaccharides and derivatives thereof, e.g. hyaluronic acid, xanthan gum, hydroxypropylmethylcellulose, particularly advantageously from the group of polyacrylates, preferably a polyacrylate from the group of Carbopols, for example Carbopol grades 980, 981, 1382, 2984 and 5984, in each case individually or in combination.

Gels used according to the invention usually comprise alcohols of low carbon number, e.g. ethanol, isopropanol, 1,2-propanediol, glycerol and water or an aforementioned oil in the presence of a thickener which, in the case of oily-alcoholic gels, is preferably silicon dioxide or an aluminum silicate, and, in the case of aqueous-alcoholic or alcoholic gels, is preferably a polyacrylate.

Solid sticks comprise, for example, natural or synthetic waxes, fatty alcohols or fatty acid esters.

Customary bases which are suitable for use as cosmetic sticks for the purposes of the present invention are liquid oils (e.g. paraffin oils, castor oil, isopropyl myristate), semisolid

constituents (e.g. vaseline, lanolin), solid constituents (e.g. beeswax, ceresine and microcrystalline waxes and ozokerite) and high-melting waxes (e.g. carnauba wax and candelilla wax)

- 5 Suitable propellants for cosmetic and/or dermatological preparations which can be sprayed from aerosol containers for the purposes of the present invention are the customary known, readily volatile, liquefied propellants, for example hydrocarbons (propane, butane, isobutane), which can be used alone or in a mixture with one another. Compressed air is also used advantageously.

10

The person skilled in the art is of course aware that there are propellants which are nontoxic per se and are in principle suitable for realizing the present invention in the form of aerosol preparations, but which must nevertheless be avoided because of their unacceptable impact on the environment or other accompanying circumstances, in particular fluorinated hydrocarbons and chlorofluorocarbons (CFCs).

15

For the purposes of the present invention, cosmetic preparations can also be in the form of gels which, in addition to an effective content of the active ingredient according to the invention and solvents customarily used therefor, preferably water, also comprise organic thickeners, e.g. gum arabic, xanthan gum, sodium alginate, cellulose derivatives, preferably methylcellulose, hydroxymethylcellulose, hydroxyethylcellulose, hydroxypropylcellulose or hydroxypropylmethylcellulose or inorganic thickeners, e.g. aluminium silicates, such as, for example, bentonites, or a mixture of polyethylene glycol and polyethylene glycol stearate or distearate. The thickener is present in the gel, for example, in an amount between 0.1 and 30% by weight, preferably between 0.5 and 15% by weight.
